

ECONOMICAL CALL PROCESSING SYSTEM AND METHOD, SUCH AS FOR
PROVIDING ONE-NUMBER TELECOMMUNICATION SERVICES

ABSTRACT OF THE DISCLOSURE

A system and associated method receive, from a local telecommunications network, a call from a first number, to a second number associated with an individual or subscriber. The system and method locally store at least the second number, and initiate a dial-up call to a central telecommunication server or a dialed-up network via the local telecommunications network. The system and method then transfer at least the second number to the central telecommunications server via the dial-up call over the dial-up network. The dial-up network can be a 1-800 network, long distance network, or other network.
